

# Project Title: AWS REST API Gateway with Lambda Integration - Mini Project

**Overview:** This mini project demonstrates how to build a serverless REST API using AWS API Gateway and AWS Lambda. The goal is to understand how API Gateway acts as a reverse proxy and integrates with AWS Lambda to expose backend functionalities securely and at scale.

**Objective:** To create and test a RESTful API with GET and POST methods connected to AWS Lambda functions using Postman.

---

## Technologies Used:

- AWS API Gateway (REST API)
  - AWS Lambda (Python runtime)
  - Postman (API Testing Tool)
- 

**Why AWS API Gateway?** AWS API Gateway is a fully managed service that allows developers to create, publish, maintain, monitor, and secure APIs at any scale. It acts as a bridge between frontend applications and backend services like Lambda, EC2, DynamoDB, etc.

## Types of APIs Supported:

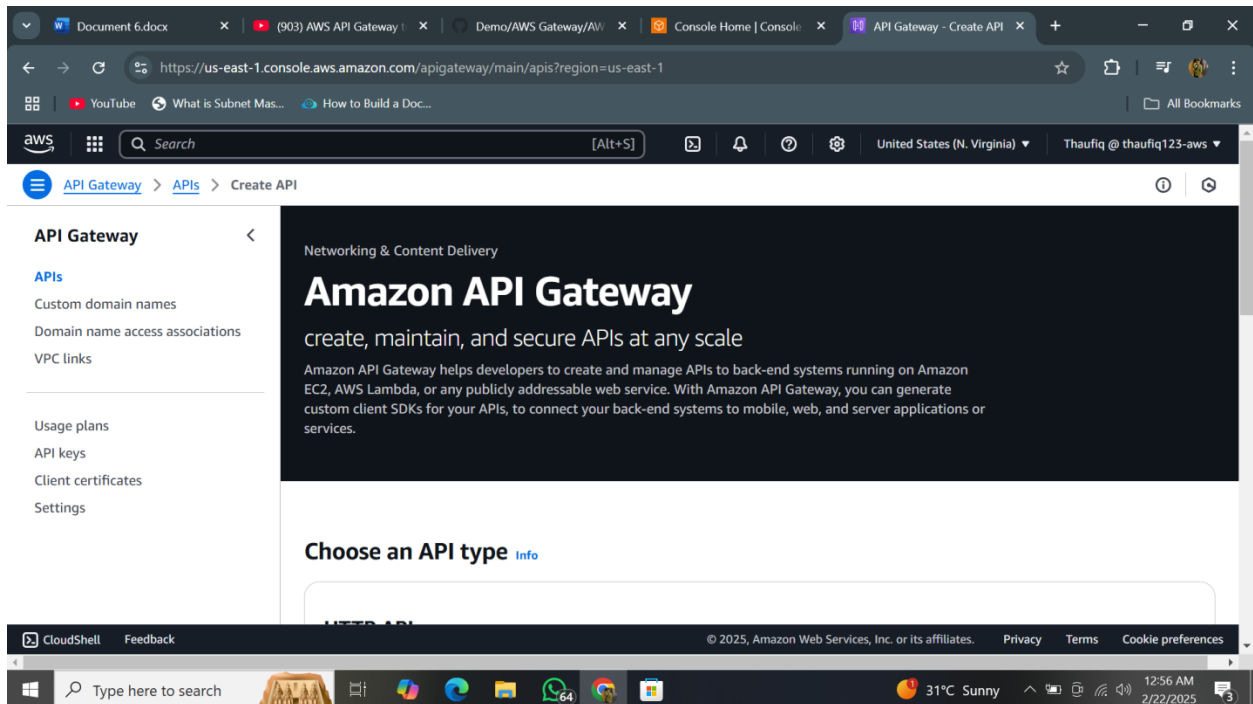

1. **REST API:** Best for standard RESTful services with full AWS integrations.
  - Supports IAM, Cognito, and Lambda authorizers
  - Can integrate with services like Lambda, EC2, DynamoDB
  - Features like throttling, caching, and request validation
2. **HTTP API:** Lightweight and cost-effective for simple APIs.
  - Faster and cheaper than REST APIs
  - Limited features and integrations
3. **WebSocket API:** For real-time, two-way communication.
  - Used for chat apps, stock price updates, etc.

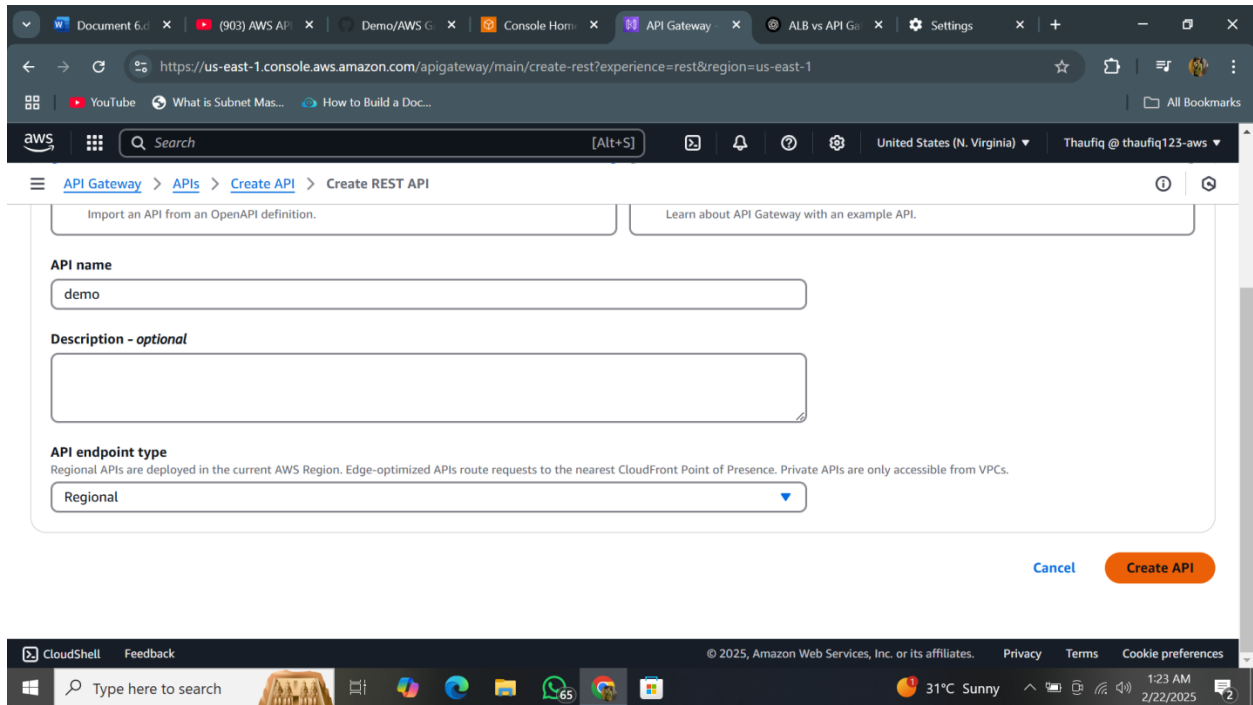

**This project uses the REST API.**

## Step-by-Step Implementation

## Step 1: Login to AWS Console

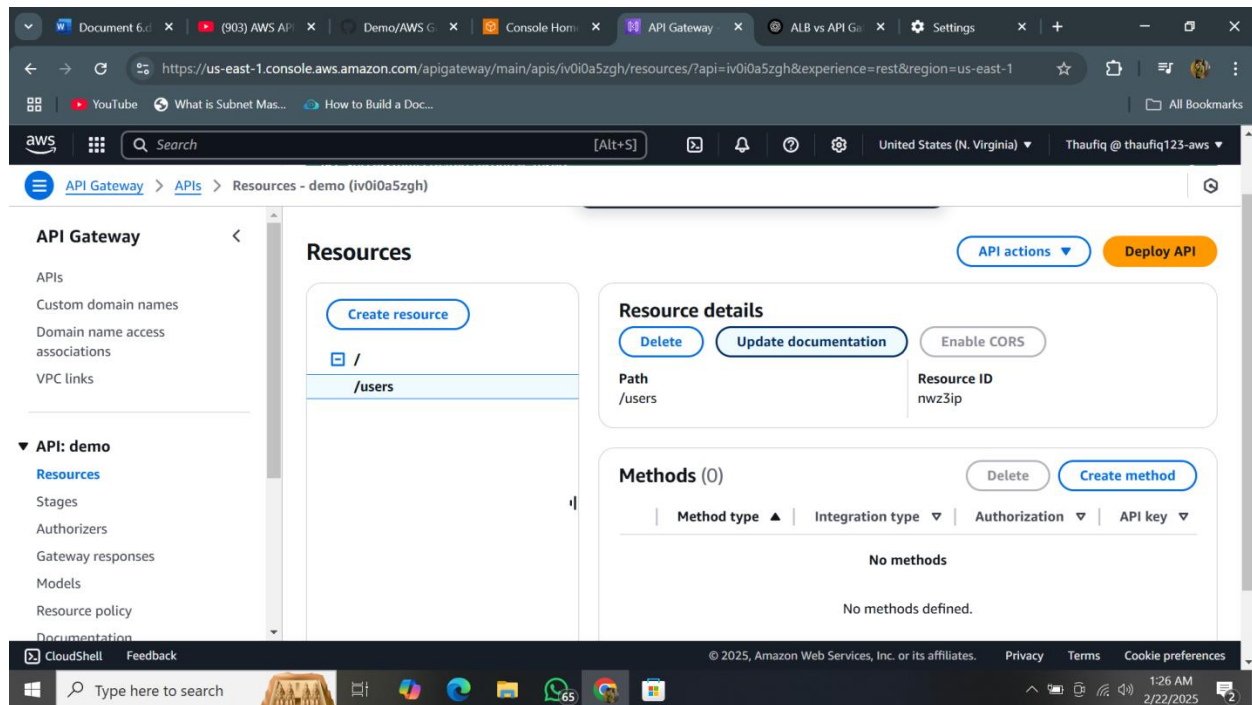

- Navigate to the **API Gateway** service
- Choose **Create API**
- Select **REST API** → Click **Build**
- API Name: demoapi
- Endpoint Type: Regional

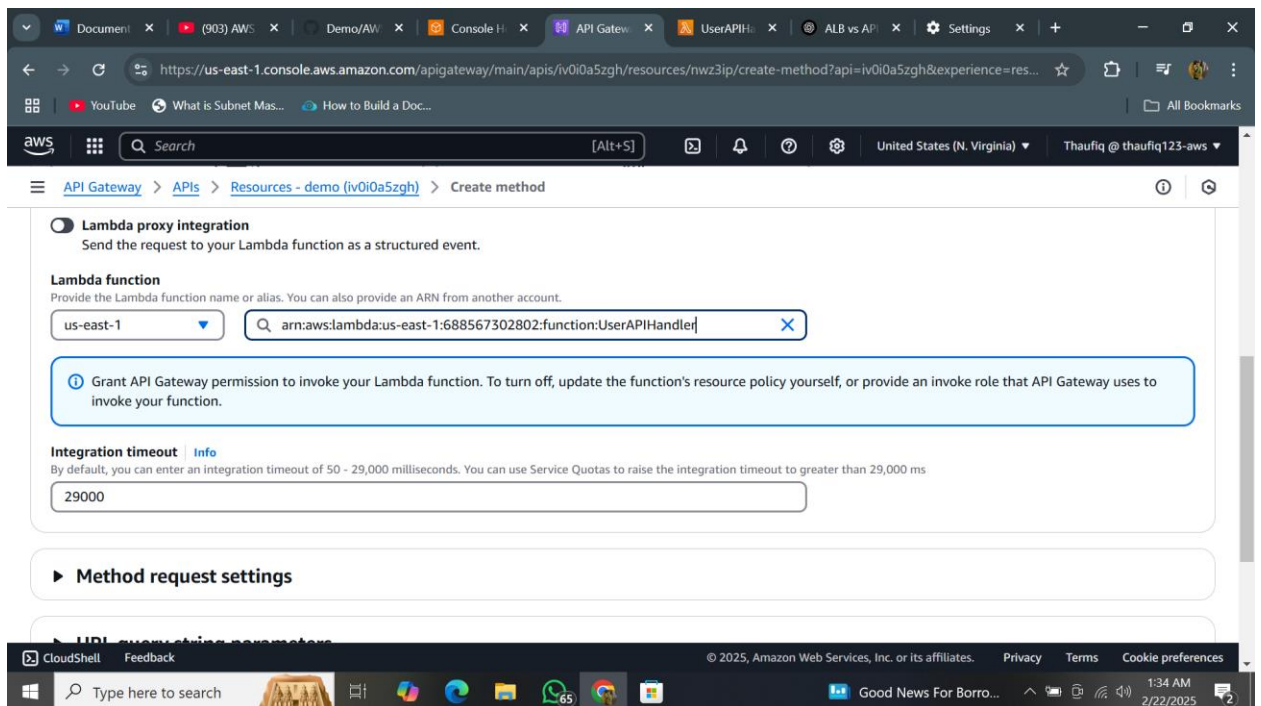

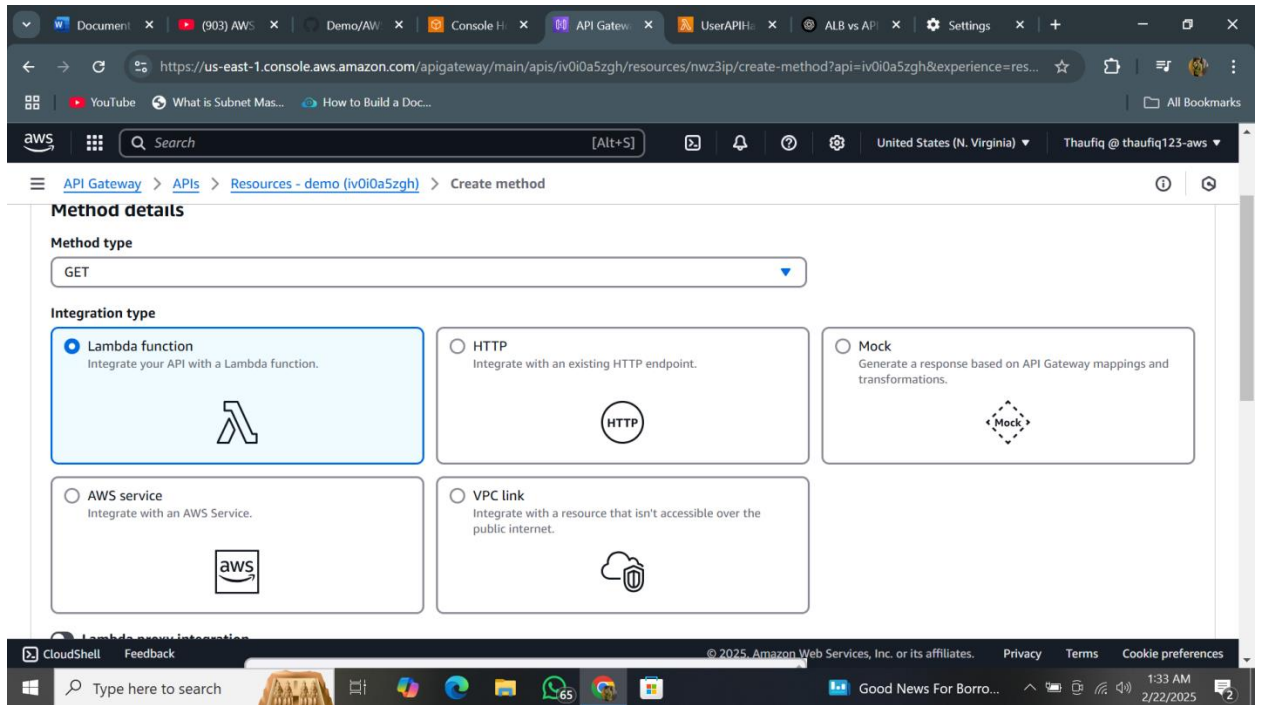

## Create a Resource

- Click **Actions** → **Create Resource**.
- Resource name: **users**.
- Resource Path: **/users**.
- Click **Create Resource**.

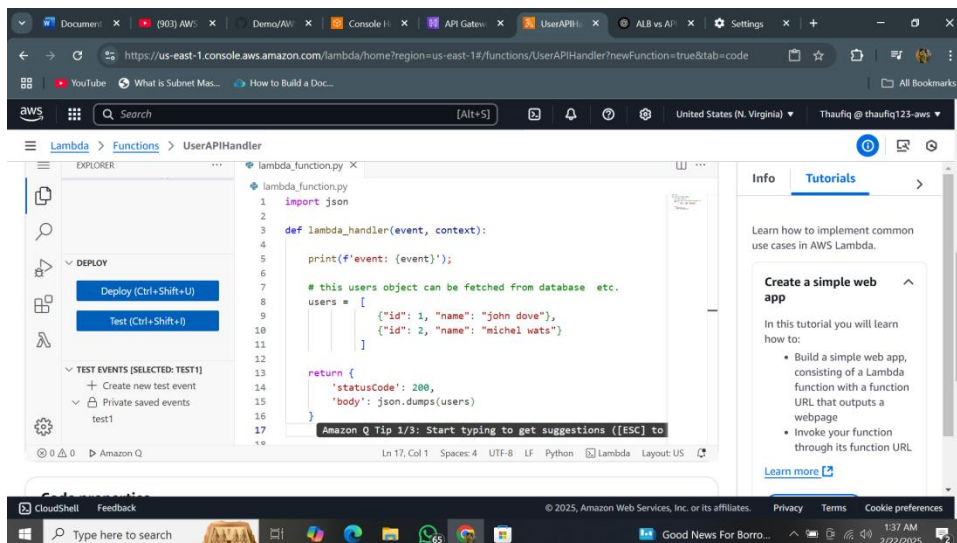

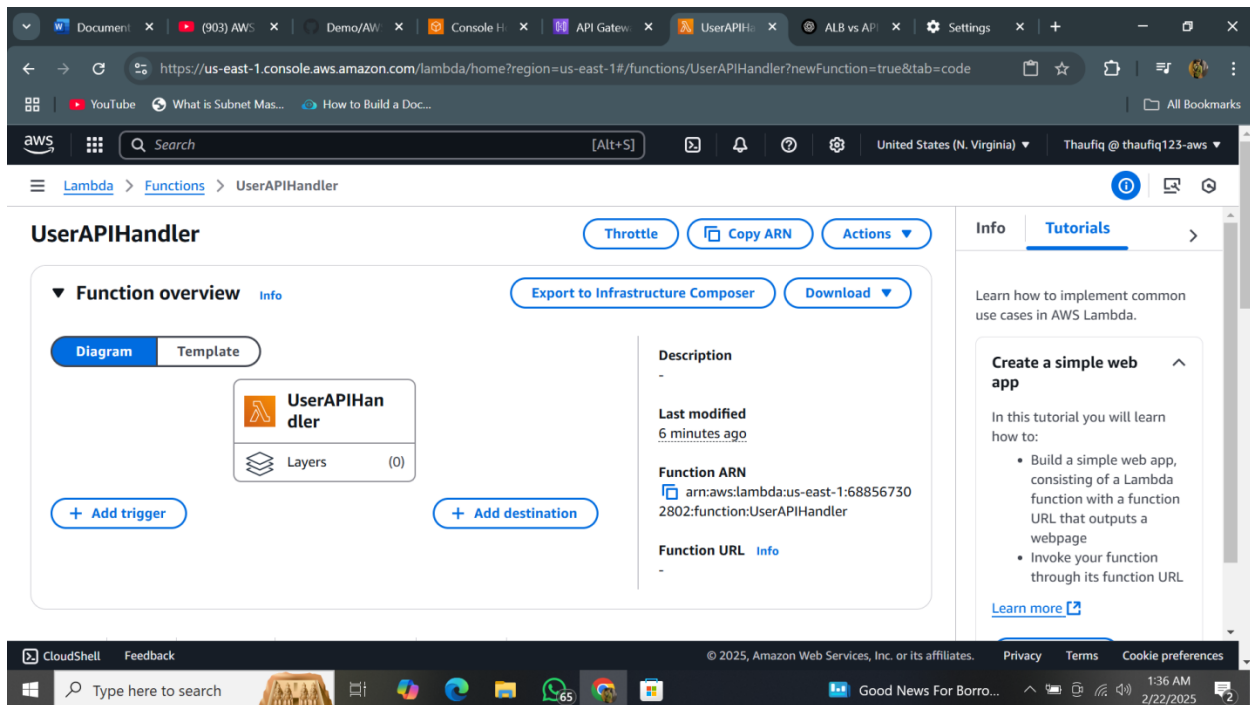

## Create a Method (GET & POST)

- Select **/users** → Click **Actions** → **Create Method**.
- Choose **GET** → Click the checkmark .
- Integration type: **Lambda Function**.
- Enter Lambda function name: **UserAPIHandler**.
- Click **Save** → **OK**.

Click create .

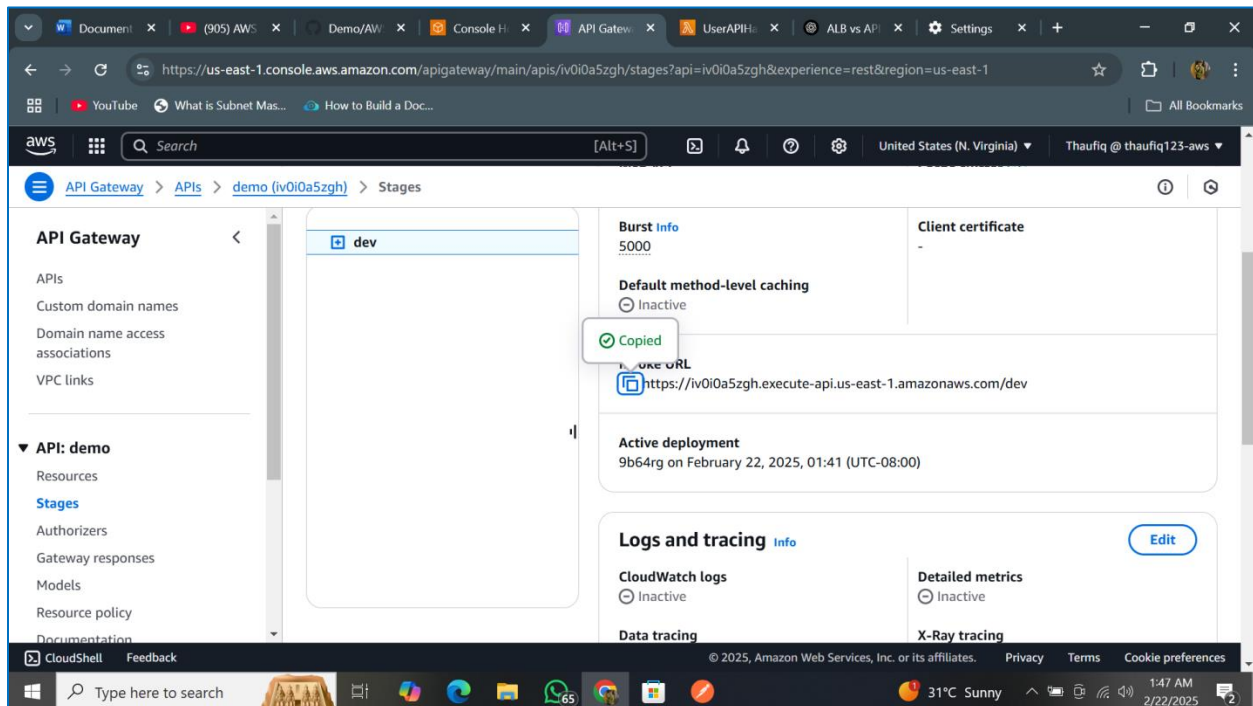

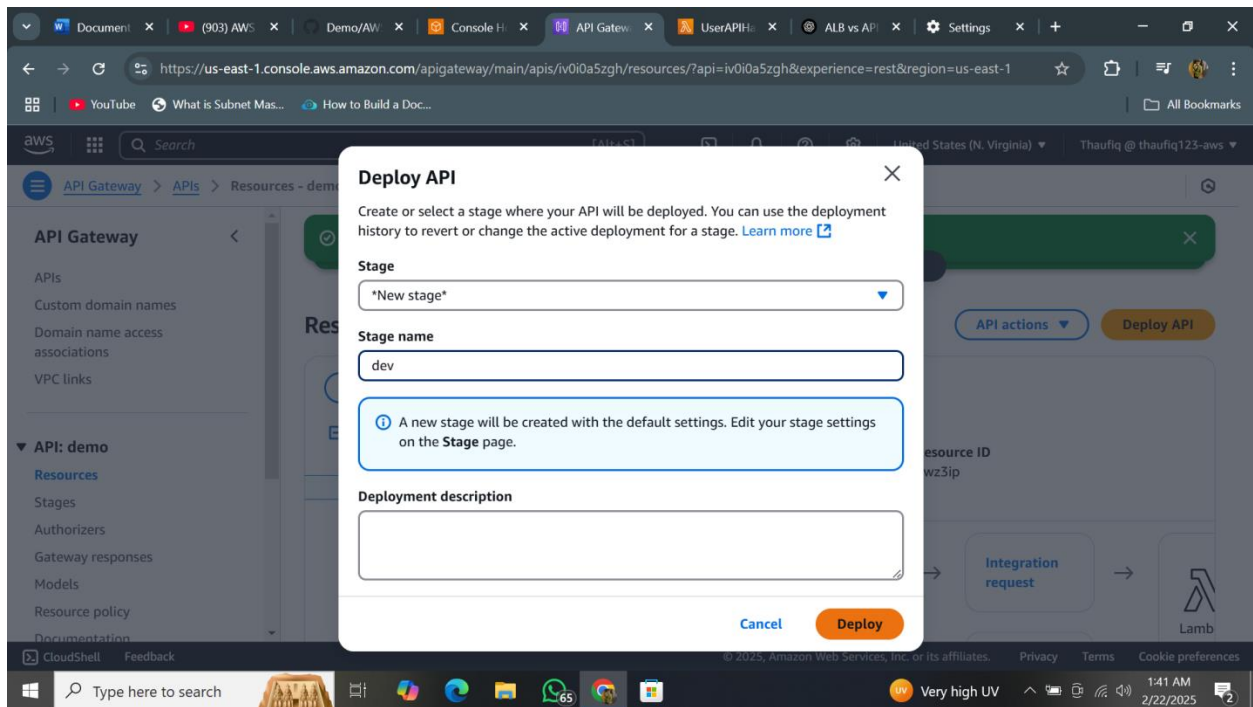

And this my lambada function i create for get users in python language

## Deploy the API

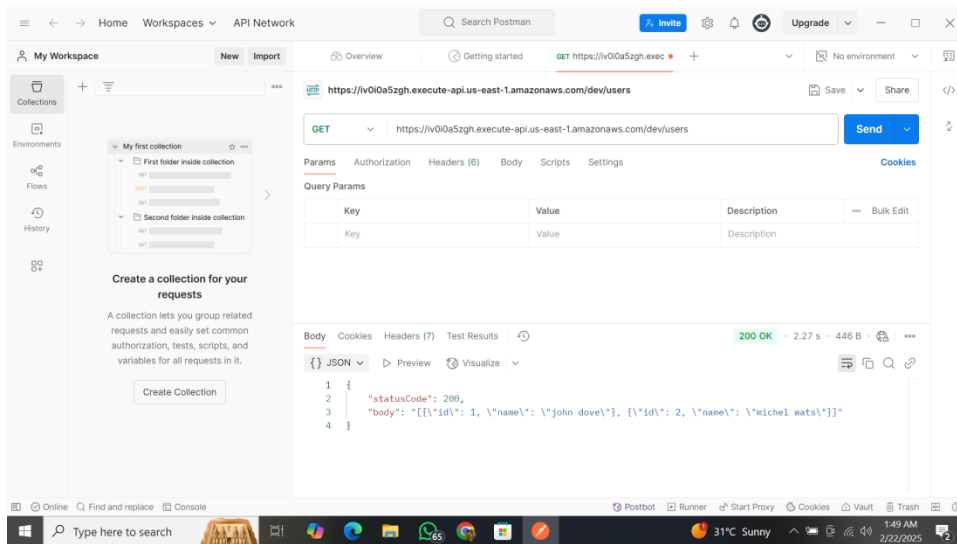

- Click Actions → Deploy API.

- Stage name: dev.
- Click deploy

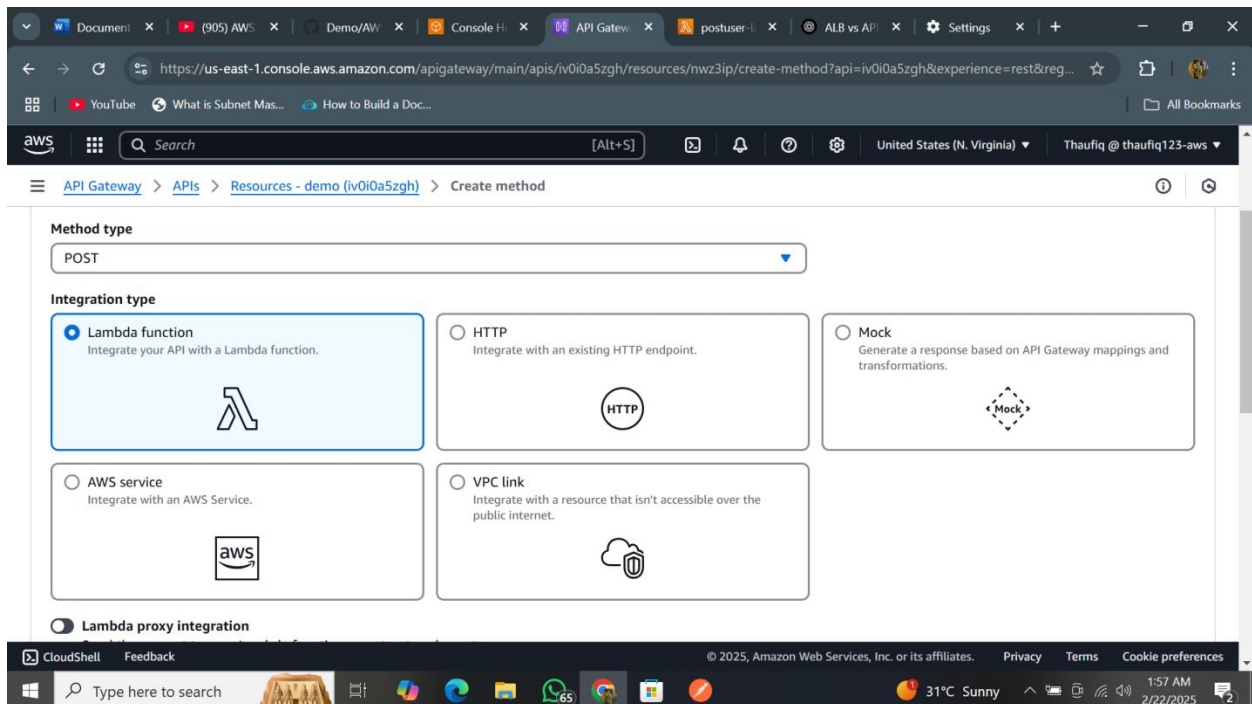

Then you get link i my is this <https://iv0i0a5zgh.execute-api.us-east-1.amazonaws.com/dev>

Lets check it in postman it working or not

Yes IT WORKING WE GET JSON OUT PUT that we write in lambda code right same for post request also

## LEST BEGIN FOR POST REQUEST

☒ **Lambda proxy integration**  
Send the request to your Lambda function as a structured event.

**Lambda function**  
Provide the Lambda function name or alias. You can also provide an ARN from another account.

us-east-1

**Grant API Gateway permission to invoke your Lambda function.**  
To turn off, update the function's resource policy yourself, or provide an invoke role that API Gateway uses to invoke your function.

**Integration timeout** [Info](#)  
By default, you can enter an integration timeout of 50 - 29,000 milliseconds. You can use Service Quotas to raise the integration timeout to greater than 29,000 ms.

**Conclusion:** This project showcases a practical implementation of AWS REST API Gateway and Lambda integration. It demonstrates how to set up resources, methods, integrate with backend Lambda functions, and test APIs using Postman

**Future Enhancements:**

- Connect API Gateway to DynamoDB for storing users
- Add authentication using AWS Cognito
- Implement validation and error handling in Lambda functions
